Colophon

This book was written and edited on various Macs around the country using Word X and its indispensable revision-tracking features, with iTunes occasionally providing background entertainment.

The screenshots were captured with Ambrosia Software's Snapz Pro X (www.ambrosiasw.com), and Adobe Photoshop Elements (www.adobe.com) was called in as required for touching them up.

The book was designed and laid out in Adobe PageMaker 6.5 on a PowerBook G3 and Power Mac G4. The fonts used include Formata (as the sans-serif family) and Minion (as the serif body face). To provide the  and  symbols, a custom font was created using Macromedia Fontographer.

The book was generated as an Adobe Acrobat PDF file for proofreading and indexing, and finally transmitted to the printing plant in the form of PostScript files.

tune the software in Mac OS X's Unix-based core. It's full of tips for the iApps, showing how to reshuffle the iTunes song order or resynchronize IMAP mailboxes in Mail.app. For the more technically inclined, it shows how to handle system administration tasks, such as backing up Apache log files or creating NFS exports from the command line.
